Family Caregivers Needed for Research Study

The University of Georgia Assistive Robotics and Technology Lab is looking for people who care for a family member with memory loss (mild cognitive impairment, dementia, Alzheimer’s disease) to provide their opinions on the potential of socially assistive technology to help persons with dementia. The family member you care for is encouraged to attend and participate in the study as well, but their participation is not required. The study will consist of a 2-hour technology demonstration and interview. No technology experience is required. The study will take place in the UGA Institute of Gerontology’s Assistive Robotics & Technology Lab; therefore participants will need access to transportation to/from this location in order to participate.

Participants receive:
- A $50 stipend per attendee (caregiver, as well as care recipient if they attend).
- Experience observing/interacting with an assistive robot.
